

Loss of Tire Pressure?

Written by Ty Whiting

Tuesday, 07 September 2010 14:09 -

You may start your BMW in the morning just about to start your journey to work and find a message stating your vehicle's tire pressure is low. This is common among vehicles with aluminum wheels after a sudden drop of air temperature. Most BMW's on the road today have a Tire Pressure Monitoring System (TPM) and warn drivers of pressure loss. When the temperature drops suddenly, the wheel may contract enough to let tire pressure escape and will alert the monitoring system. If you live in the Cleveland area, tonight the ambient air temperature is predicted to fall approximately 30 degrees and may trigger your vehicle's TPM alert. If this occurs please contact our service department by phone (440-585-9990) or by our Classic BMW iPhone app and we can advise you of your next move. If you have run-flat tires and would prefer to drive to our location, we can help you as well.

The pictures above and below show the TPM alert on our BMWs (depending on model).
